

**DEVELOPMENT OF ARTICULATION DRILL BOOK FOR PERSONS  
WITH CLEFT PALATE IN MARATHI**

**SHINDE VRUSHALI MADHUKAR**

**Register No: 20SLP034**

A Dissertation Submitted in Part Fulfilment of  
Degree of Master of Science (Speech-Language Pathology)

University of Mysore, Mysuru

**ALL INDIA INSTITUTE OF SPEECH AND HEARING,  
MANASAGANGOTHRI,  
MYSURU-570006**

**AUGUST, 2022**

## **CERTIFICATE**

This is to certify that this dissertation entitled “**DEVELOPMENT OF ARTICULATION DRILL BOOK FOR PERSONS WITH CLEFT PALATE IN MARATHI**” is a Bonafide work submitted in part fulfillment for degree of Master of Science (Speech-Language Pathology) of the student Registration number 20SLP034. This has been carried out under the guidance of a faculty of this institute and has not been submitted earlier to any other University for award of any other Diploma or Degree.

## **Acknowledgement**

I would like to thank and express my gratitude to the **Almighty**, who blessed me with the courage and strength to face all the challenges of my life. I would like to thank him for every small accomplishment and success I've had.

A very special and warm thanks to my **guide and director of AIISH Dr. M. Pushpavathi** who throughout the study supported me, guided me in all aspects and gave me valuable suggestions and time. Thank you so much ma'am, for being so patient throughout this journey, for keeping faith in me and giving me the space to express my views openly. Thank you so much ma'am.

I would like to extend my sincere gratitude to **Ms. Suhsma Manjunath**, ma'am you are like the blessing for me. Thank you so so much for being there, bearing me and my mistakes, correcting me everytime. I'm so grateful for all your help.

Special thanks **Dr. Kadambari, Ms. Mansi Karnad, Ms. Bundele** for guiding me and helping me with the content validation.

I would like to mention my heart felt gratitude to my parents. I couldn't have done this without my aai, papa, and didi. Thank you **aai** for caring me, loving me & believing in me. **Papa**, I love you so much, this is all because of you. **Didi**, thank you for supporting me and being my strength. **Vivek and Melech** thank you for being the best brother's, listening to me so much and supporting me.

I would like to thank my **best friends Anuja and Anusha** for making me calm when I'm impatient, making me laugh when I'm sad and believing in me that I can do it. Thank you for everything.

I would like to thank all my close friends **Yasha, Ankita, Mudra, Bhavani, Harshada, Madhurya, Nadia, Ashish, Amit** for being my survival kit at AIISH and for all the amazing memories.

I would specially like to thank my dearest friend **Sahil sharma** for everything you have done for me, I don't think I could have done anything without your support. Thank you for believing in me, for being my pillar of strength in tough times, for being my unpaid therapist and giving me so beautiful and amazing memories that I can cherish all my life. Thank you so much.

I would also like to thank my lovely friends **Haripriya, Malvika, Gayatri, Hiba, Aishwariya sooraj, Alfiya, Ilakiya, Swathi c, Swathi s, Trupti, Navya, Delvin, Akash, Chandana, Gopika and Sujisha** for helping me, being there when I needed, and for making my life in aiish memorable.

Thanks to my lovely classmates of section B with whom I have spent my good moments, had all the fun and made my life best in AIISH.

Special thanks to my junior's **mansi, muskan k, disha, malavika, ambika, muskan and hithendra** who have helped me and made my journey beautiful.

Thank you for everything.

## CHAPTER I

### INTRODUCTION

Craniofacial conditions are structural anomalies that occur at birth as a result of abnormal embryological development. Between the fourth and tenth week of development of the embryo or foetus, there is a halt in embryological growth that causes craniofacial differences (Peterson-Falzone, Hardin-Jones, & Karnell, 2001). The fourth most common birth defect and the most prevalent facial congenital defect is cleft lip and palate (CLP). A cleft is an abnormal opening or fissure in an anatomical structure that is normally closed. A cleft lip is the result of failure of parts of the lip to come together early in the life of a fetus.

CLP have multiple underlying causes. Geographical area, gender, population, dietary habit, use of drugs, smoking, drinking alcohol, low water contaminant sources, and birth weight have all been hypothesized as factors that contribute to the incidence rate of CL/P in newborns. Genetic and environmental risk factors have been identified as triggers for syndromic CL/P. However, the etiology of the more common non-syndromic CL/P remains largely unknown.

In a survey done in 2000 by the Tata Institute of Social Science in India, 1 million home visits were conducted, and the incidence rate of clefts was estimated to be one child per 781 births. It indicates that each year in India alone, 35,000 children are born with craniofacial defects. In the world, one in every 700 live births results in an oral cleft of some kind, such as a cleft lip, cleft lip and palate, or isolated cleft palate (World Health Organization [WHO], 2001).

CL/P occurs in between 0.30 and 2.65/1,000 live births worldwide. According to Jones et al., 2001, on an average, one live birth results in a cleft in every 500–750 births. Reddy et al., 2010, reported that there are 1.09 cleft lip and palate defects per 1000 live births in the Indian state of Andhra Pradesh. According to this study, 65 percent of the children were male born with clefts and according to the distribution of the different types of clefts, 33% had CL, 64% had CLP, 2% had CP, and 1% had the uncommon craniofacial cleft. Unilateral cleft lips were found in 79% of the patients. Of the unilateral cleft lip 64% were left sided. There was a significant correlation of children with cleft being born to parents who shared a consanguineous relationship and those who were illiterate with the odds ratio between 5.25 and 7.21 for consanguinity and between 1.55 and 5.85 for illiteracy.

The physical and psychological abilities of individual with CLP are affected in a number of ways, including nasolabial appearance, bone structure, swallowing, hearing, dental occlusion, delayed development, feeding issues in infancy as they age, and lifelong social and psychological issues as a result of the facial deformity. Individuals' quality of life, social development, and the nation's economy are all impacted. Infants with CLP experience feeding and nutrition issues because they are unable to suck on either their mother's nipple or from a bottle. As a result, the baby's weight and growth are affected because there isn't enough milk or food for growth. In addition to cosmetic problems, individual with CLP have difficulty producing labial sounds. Hearing loss and ear infections can occur due to the fluid build up in the middle ear caused by otitis media, Within the first six months of life, this condition manifests in a child with CLP. Dental issues include irregularities in tooth size and shape, such as the permanent lateral incisor's abnormal size and shape in the side of the cleft, irregularities in tooth position, and delays in the eruption of permanent teeth and the

formation of permanent teeth. In addition to these issues, individual with CLP also struggle with their speech and language. Compared to language issues, speech issues are thought to be more prevalent in children with CLP.

Individual with a CLP have speech problems which result from velopharyngeal dysfunction. As a result, air enters the nose rather than the oral cavity because the soft palate cannot move upward to make contact with the nasal cavity. The term "hypernasality speech" refers to this issue. This case can be treated with a surgery to provide the velopharyngeal closure. The velopharyngeal deficiency in patients with CLP can be treated with pharyngeal flap and sphincter pharyngoplasty, which are regarded as safe procedures.

The majority of children with CLP will still have trouble developing their speech sounds even after the surgical repair (Hardin-Jones & Jones, 2005), thus affecting the speech intelligibility of an individual with CLP. Atypical resonance and misarticulated speech were two of the many factors listed by Whitehall and Chau (2004) which affects speech intelligibility in children with CLP. Children who were born with CLP are more likely to experience delays in early language development and speech development. Within the age range of 6 to 12 months, children with CLP exhibit variation in their sound production (Chapman, Hardin-Jones, Schulte, & Halter, 2001). Children with CLP have a limited range of phonological sounds in their repertoire, which includes vowels, glides, nasals, and glottal production of bilabial and velar sounds (Chapman et al., 2001). The most remarkable speech production problems demonstrated by the children with CLP are those related to velopharyngeal inadequacy including hyper nasality, audible nasal emission, weak pressure consonants and compensatory articulatory patterns.

CLP is the congenital disorder that affects the articulation structures most frequently. By changing the sizes and shapes of resonators, the outgoing breath stream and voice are modified through articulation. Speech sounds that are substituted, added, omitted, distorted, or in the wrong order are known as articulation errors. Such motorically-based errors are usually consistent. Since the sounds produced differ noticeably from normative productions, errors are referred to as "phonetic" in nature (Bauman-Waengler, 2000). When the movements of the articulators, such as the lips, tongue, palate, or resonating cavities, differ from normal articulations, phonetic disorders in cleft occur. Phonetic compensations include a glottal stop, velar, and pharyngeal production, as the kid tries to make the sound in a different way to compensate for the inability to build oral pressure due to poor velopharyngeal function. The glottal, pharyngeal, and velar productions have been characterized as phonetic and articulation, respectively, since they show an evident and productive compensation.

McDermott (1962), claims that the majority of CLP speakers exhibit /s/ distortions. They frequently misarticulate affricates and fricatives first, then plosives, glides, and finally nasals. Errors on the first three classes of sounds are thought to be primarily caused by velopharyngeal inadequacy. Children with CLP exhibit more articulatory errors than typical children, according to Philips and Harrison's (1969) research. They noted that the articulation scores of 94% of pre-schoolers with CLP who were 3 years old and older were found to be lower than those of comparable-aged healthy children.

Peterson-Falzone (1990) investigated 240 kids with repaired CLPs who were between the ages of 4 years to 10 years and 11 months. The findings showed that articulation issues related to place or manner of production were present in more than 90% of the young school-aged children. According to Witzel (1991), approximately

25% of children with cleft lip and palate recover normal speech on their own after the palate has been repaired, but the remaining 75% require periods of speech therapy throughout childhood and adolescence to achieve acceptable speech production. According to Chapman et al. (2003), English-speaking toddlers with clefts produced oral stops, liquid labials, dentals, and velar sounds less accurately in their simple words. Children with CLP produced fewer oral stops than children without CLPs did at about one year of age, according to research by Chapman et al., 2009. Individual with CLP frequently display unusual articulation patterns. Glottal stops and pharyngeal fricatives are the most common compensatory articulations produced by these individuals. Others may develop compensation for palatal fistula or malocclusion (Petersen-Falzone 1989, Trost-Cardamone 1990).

### **1.1 NEED OF THE STUDY**

It is necessary to correct the articulatory errors using various techniques because articulation disorder is most frequently seen in children with repaired and unrepaired cleft lip and palate due to their structural abnormalities and persistent VPD. Standard articulation therapy is used to treat malocclusion, velopharyngeal valving disorder, and other functional sequelae that result in misarticulation (Kummer, 2011). As a result, articulation approach is crucial for improving sound production in children with CLP and the use of articulation drill material is also crucial for establishing correct articulation placement and enhancing speech intelligibility. As there is no published articulation drill material, particularly for children with CLP, available in Marathi language, the clinician's task is made easier by using a single source of material that is articulation drill for both assessment and management.

Marathi language is mainly spoken in the state of Maharashtra. There are approximately sixty-two million speakers of Marathi, including speakers outside the native state of Maharashtra. Marathi occupies major geographically unique position as it is spoken in the area which link two major language families, that is Indo-Aryan in the north including languages like Gujrat and Hindi and Dravidian in the south including language like Kannada and Telugu. Marathi language consist of 14 vowels, 36 consonants. Marathi's primary word order is SOV (subject-object-verb). Its consonant cluster usage is extremely limited, and the word's first syllable typically receives the most stress. As children with CLP have trouble developing the intra oral breath pressure necessary for the production of these consonants, they are known to be most affected when producing pressure consonants. In the state of Maharashtra there are around 13 hospitals which provide free cleft lip and palate surgeries. Also after the surgery, rehabilitation in terms of speech therapy is essential for child's speech and language development. In the Marathi language, there is no articulation drill book. Hence, it is imperative to develop these material resources for speech language pathologists (SLP), to provide them as well as parents with the word list of each target sound in a systematic manner in different phonetic context. The articulation drill book will help to work with individual with CLP effectively. When only one source is used, speech therapy time will be used more efficiently because less time will be lost changing, arranging, and moving around various materials. SLP should have the resource material to understand the problem and what management options are suitable for the cleft lip and palate children. However, the resource material in the area of management for children with CLP who speak Marathi is limited. Hence it is necessary to develop the articulation drill book in Marathi. Articulation drill material comprises of syllables, word at different position, 2-3 word phrases, and grammatically complete

sentences making it accessible for the SLP's. Drill material produces effective results in a relatively short period of time. The present material developed can be used by teachers of the elementary grades to facilitate the growth of consonant mastery.

## **1.2 DESCRIPTION OF MARATHI LANGUAGE**

One of India's eighteen official languages, Marathi Language belongs to the Indo-Aryan branch of the Indo-European language family and is spoken in the state of Maharashtra. With 30 districts spread throughout 7 sociolinguistic regions in the state of Maharashtra, which has a total area of 118,758 square miles, Maharashtra is home to six major dialects. There are around 62 million Marathi speakers worldwide, including those living outside of Maharashtra, the language's native state (Cardona & Jain, 2003). The Indo-Aryan family of the north and the Dravidian family in the south are linked through the Marathi language. The outer circle of Indo-Aryan languages includes this language (Grierson 1905) Marathi and other Indo-Aryan languages share a number of phonological characteristics. It has a sound design with a limited usage of consonant clusters and stress. Sanskrit is the foundation of Marathi's basic vocabulary, although over time, it has substantially incorporated words from many other languages. The words in Marathi have been influenced by words from nearby Dravidian languages.

### **Phonology of Marathi language:**

There are 14 vowels in the Marathi language, all of which, with the exception of /ə/, can be either short or long. The meaning of a word is influenced by the length of a vowel. Along with 36 consonants, The pauses and affricates t—th, b—bh, p—ph, d—dh, k—kh, g—gh, and others are distinguishable between aspirated and unaspirated. Aspirated consonants are created by a strong airburst. Different apical and retroflex consonants include /t/ – /t̪/, /d/ – /d̪/, /n/ – /n̪/, /ɾ/ – /ɻ/ Contrary to retroflex consonants,

which are generated when the tongue is curled such that the underside of the tongue reaches the roof of the mouth, apical consonants are produced when the tongue tip contacts the roof of the mouth.

Children with cleft lip and palate are at risk for certain speech and resonance disorder secondary to velopharyngeal insufficiency or incompetence, oral anomalies and dental malocclusions. Although speech proficiency improves with age, children with CLP may continue to exhibit speech problem consisting of articulation error into school age, adolescence and beyond (Sell, 2001). These deficiencies can present in adulthood also. Soon after an intervention of language problem, articulation disorder has to be intervened as it affects speech intelligibility. 2 Placement error is usually seen in children with CLP which consist mostly of pressure consonants. Use of articulation drill material is essential in order to establish correct the placement of articulation and to improve intelligibility of speech.

Among the various hospitals present in different states of India which provide surgeries for children with CLP, in the state of Maharashtra there are around 13 hospital of Smile train programme which provides free surgery and is located in Jalgaon (Asth plastic and cosmetic surgery centre),Aurangabad (Bembde hospital ),Mumbai suburban(Shushrusha citizen cooperative hospital),Mumbai Thane (Meera Nx hospital ),Mumbai(SRCC hospital), Latur(Lahane hospital), Pune(Poona hospital), Akola(Shriram hospital), Nashik (Vedant hospital LLP), Kolhapur(Western India institute of neurosciences ),Wardha (Acharya vinoba bhave rural hospital), Wardha (Sharad pawar dental college & hospital), Solapur (Shri marakandey solapur sahakari rughnalaya and research centre niyमित).

As without standard, readily available material it is difficult to document the effect of surgery in the improvement of articulation in children with CLP. Also, the resource material is limited in the area of management for children with CLP in Marathi language. In this view, it is imperative to develop articulation material for children with CLP. Hence, the present study was aimed at developing articulation drill book for children with CLP in Marathi language.

### **1.3 Aim of the study:**

To develop an articulation drill book for persons with CLP in Marathi language.

### **1.4 Objectives:**

- (a) To identify the pressure consonants in Marathi language.
- (b) To compile the wordlist and picture material (meaningful words) loaded with pressure consonants in initial, medial, and final position in Marathi language.
- (c) To compile paired words loaded with pressure consonants in Marathi language.
- (d) To develop sentences loaded with pressure consonants in Marathi language.
- (e) To obtain feedback of the developed stimuli by native speaker of Marathi SLP's.

## CHAPTER II

### REVIEW OF LITERATURE

Cleft of the lip and / or palate (CLP / P) is a congenital deformation that occurs in-utero during the first trimester of pregnancy. This is caused by a confluence of environmental and genetic variables. A cleft can occur in isolation or as a major / minor malformation which may be associated with a syndrome. The impact of the palatal cleft may be evident during the early vocalization of babies before surgical management. This may persist long after an adequate oral pharyngeal mechanism has been established.

Cleft lip and palate can be associated with feeding difficulties, dental anomalies, frequent otitis media, intellectual impairment, facial deformity, and communication disorders. Communication disorders can vary from hearing loss, delay in speech and language development, resonance disorder such as nasal air emission, nasal grimace and hypernasality, and presence of compensatory articulation leading to unintelligible speech.

#### **2.1 Speech disorder in individual with cleft lip and palate**

Cleft of the lip are repaired early in the infancy, and create speech problems only if subsequent tissue contraction makes it difficult for the lips to approximate to one another along their entire length. Individuals with CLP report to have misarticulation in which both place and manner of articulation are affected. They are reported to misarticulate voiced sounds more than their voiceless cognates. The consonant /m/, /n/, /j/ are most correctly articulated at least 80% of the time. Contrary to this, Spriesterbach (1956) and Mcwilliams (1958) reported difficulty with nasals and fricatives in children with cleft lip and palate. Mcwilliams et al., (1990) reported the

individuals with CLP frequently substitute glottal stops for nasal fricatives and plosives, further their speech sound articulation is generally reported to be inappropriate. Atypical consonant production, altered laryngeal voice quality, aberrant nasal resonance, abnormal nasal airflow, and nasal or facial grimacing are all indicators of speech in individual with CLP (Roopa et al., 2009).

Various studies have been conducted to understand the articulatory production in children with repaired CLP (Fletcher, 1978; Philips & Harrison 1969; Riski, 1979). Some young children with CLP are reported to have normal articulation (Dalston, 1990). However, as a group, their individual score was below the available norms on the articulation tests or lower than age-matched controls (McWilliams and Musgrave 1977; Morris 1962; Philips & Harrison, 1969; Van demark, Morris & Vandehaar 1979).

Bzoch (1965) studied the articulation proficiency and error patterns of preschool CLP and normal children in the age range of 3 to 7 years. 60 children with cleft of the secondary palate were compared to 120 typically developing preschooler without CLP. A set of picture card were used to elicit single word responses from each child. A total of 82 sound elements were tested in the initial, medial and final position. The results indicated that the children with CLP produced only 50% of the test sounds correctly, whereas the mean average for the control group was 79%. It was also found that 5-year-old children with CLP presented with decreased errors of articulation than 3-year-old normal children. The result also indicated that children with CLP exhibited substitution and distorted errors more than twice as frequently. Additionally, the omitted sounds were almost four times as frequently when compared to the control group. The high occurrence of omission errors in the children with CLP emphasized the extent of deficiency of articulation skills in this population. Moll (1968) reported the consonants

involving lingual contacts to be more defective than those including the lips only across all manner of productions.

Fletcher (1978) analysed the articulation data from 70 subjects with CLP and identified a sibilant-non sibilant contrast. The investigator sorted the sounds, studied into three categories – (1) sibilants: /s/, /z/, /ʃ/, /tʃ/, and /dʒ/, (2) non-sibilant fricatives: /θ/, /v/, /f/, and (3) plosives: /p/, /b/, /t/, /d/, /k/, /g/. According to the author, this classification resulted in more homogenous groupings of speech sounds than the more traditional assignment of speech sounds to fricative and affricate categories. The study reported mean error percentage of 47 for sibilants, 24 for non-sibilant, and 17 for plosives. The findings were consistent with those of McWilliams (1958) and Priestresbach et al., (1956). Wherein, the subjects misarticulated over 40% of /s/ speech sounds studied in initial, medial, and final position of words. This latter finding was consistent with previous reports that have identified /s/ as the speech sound most frequently and consistently misarticulated by children with CLP (Byrne et al., 1961). Thus, from the above study it can be concluded that fricative sounds are affected in children with CLP.

Van Denmark et al., (1979) conducted a longitudinal study to investigate patterns of articulation abilities in 351 subjects with CLP from birth to 18 years. Up to the age of five, all the subjects underwent examinations every six months, and then once a year after that. IOWA Pressure Articulation Test and Templin Darley Screening Test of Articulation were studied and administered for the same, which consisted of a total of 105 items which comprised of 149 consonants and vowel sounds. The data was collected over a 15 years period and presented to be heterogeneous. The results indicated that the children with CLP improved in their articulation skill until age of 10 years and this trend continued after age 10 also, but, at a more gradual rate. The authors

also reported that 80% of the test items were correctly produced by the children with cleft at 16 years of age.

The above studies strongly suggest presence of articulatory deficits in children with CLP across different age ranges. It was also observed that the traditional method of SODA error analysis was the widely used form of assessment. Later in mid-1980's, the studies were formed on describing articulation errors in terms of compensatory articulation (Trost & Cordermon, 1981). The compensatory articulation is reported to be seen for pressure consonants such as stops, fricatives, and affricates.

## **2.2 Compensatory Articulation in individual with cleft lip and palate**

Compensatory articulation (CA) is a distinctive category in errors of place of articulation commonly observed in individuals with cleft lip and palate. This term describes specific errors of place of articulation that may occur in individual who have inadequate closure of the velopharyngeal valve or a cleft or fistula in the hard palate. Morley (1967) and Bzoch (1979) described compensatory articulation as “compensatory adjustments” and “laryngeal and pharyngeal gross substitution errors.” Several studies have reported that, in most instances where compensatory articulation are substituted for target phonemes, the correct manner of articulation is preserved, while correct place of articulation is sacrificed (Counihan 1956, 1960; Spriestersbach et al., 1961). Compensatory articulation is classified into several types based on their position in the vocal tract where the sound is produced. There are different classification systems of compensatory articulation. The earliest classification of compensatory articulation was by Trost (1981). Recent classification of system includes those by John et al., (2006) and Henningson et al., (2008). Henningson et al., (2008) classified the consonant production errors as abnormal backing of oral target to postuvular place,

abnormal backing or oral target with place as oral, nasal fricative, nasal consonant for oral pressure consonant, nasalized voiced pressure consonants, and weak oral pressures.

Compensatory articulation is reported to be acquired at the age of 6 months (Bzoch, 1997). Several studies have been conducted to investigate the compensatory articulation in children with CLP. A study by Chapman (1991) reported that infants with CLP produce half the number of consonants compared to that of infant without CLP. Thus, having an impact on the composition of early phonetic inventories which includes high pressure consonants. Apart from this, studies were also done to investigate the articulatory errors in pre-schoolers. A study by Jones et al., (2005) documented the presence compensatory articulation error in 25% of pre-schooler with mean age of 42 months with repaired CLP. A similar study by Mary et al., (2005) reported that pre-schooler with CLP presented with glottal / pharyngeal articulation during the significant production. Glottal stop, glottal fricative, mid dorsum palatal stop and nasal substitution were also reported.

Studies focusing on school going children indicated increased errors on nasal production and pressure consonants with maximum errors on fricative and affricate compared to plosives (Vandermark et al., 1979). Paliiopei et al., (2005) evaluated the articulation abilities of individuals with CLP between the ages of 5-15 years. The results indicated compensatory articulations in the participants who had received a delay in hard palate closure. A study by Albustanji et al., (2014) reported compensatory articulation in 71 % of children with mean age of 6.7 months, despite of early palatal closure. Further, the authors also reported the pharyngeal fricative and glottal stop to be the frequently observed error.

Jones et al., (2018) conducted a study to investigate the nasal substitution in early words of toddler in CLP. Thirty-four toddlers with non-syndromic CLP and 20 non cleft toddlers, followed from age 13 to 39 months. An assessment was carried in 9, 13, 17, 21, 27, 33, and 39 months of age. The results indicated that 67% of toddler in cleft group and 35% of toddler in non-cleft groups produced nasal substitutions in their early words. Parisa Rezaei et al., (2020) reported a higher rate of compensatory misarticulation (71.1%) in school going children of age 3-7 years. Thus, from the above studies it can be concluded that children with cleft lip and palate demonstrate compensatory articulation leading to unintelligible speech.

Most of the studies have reported the common types of compensatory articulation errors seen in children with CLP are glottal stop substitution for /k/ and /g/, pharyngeal stop substitution for sibilant fricatives /s/ /z/ /ʃ/ /ʒ/ or for oral affricates /tʃ/ /dʒ/, pharyngeal fricative substituted for oral affricates /tʃ/ /dʒ/, pharyngeal affricate substituted for sibilant fricatives and affricates ,posterior nasal fricative substituted for sibilant fricatives or any of the stop consonants ,laryngeal fricative , velar fricatives, mid- dorsum palatal stop (sounds like a mix between /t-k/ or /d-g/) substituted for /t/ or /k/ and /d/ or /g/,mid dorsum palatal fricative substituted for velar fricative (Trost,1981; Kawano et al., 1985).

Similar studies have been done In Indian context in children with CLP, indicating the presence of compensatory articulation which is predominantly glottal stop followed by weak oral pressure consonants and velar stop by Gopi sankar (2012), Savitha et al., (2018), Deepthi et al., (2020), Aparna et al., (2020) and Manjunath et al., (2022).

### **2.3 Intervention of Articulation Disorder in individual with CLP**

Research has indicated the presence of compensatory articulation, even after the surgical management, leading to reduced speech intelligibility (Moris & Vandehaar, 1979). Thus, inviting the attention for speech therapy in individual with RCLP. Articulation therapy is provided mainly through auditory, visual and tactile cues. These cues help to achieve the articulation better and faster. In majority of children, proper articulatory positioning will be the therapy's initial objective. The American speech and hearing association (ASHA), categorizes compensatory articulations are categorized as “Treatable errors”. They emphasize the objective of articulation therapy to correct the oral place of articulation and to establish the oral pathway of airflow.

Articulation therapy may turn to the mastery of phonemic patterns when the child learns the proper phonetic patterns (Trost-Cardamone & Bernthal, 1993). The principles of therapy are essentially the same for children with CLP as they are with any other child, but the impact of cleft is always considered. Research also suggested that establishing stops and fricatives in a few sounds may help to generalize those qualities in other sounds. Several studies have been conducted focusing on the intervention of cleft lip and palate and are discussed below.

Several therapy techniques have been discussed in the literature addressing intervention of individual with cleft lip and palate. Paul, (2001) proposed child-centred approach, hybrid approaches (milieu teaching, script therapy) and clinician-directed approaches (drill, drill play modelling) approaches to increase early vocabulary in children with cleft lip and palate. Shriberg and Kwiatkowski, (1982) found drill and play form of activities to be superior compared to structured play or play in terms of effectiveness and efficiency. Thus, articulation drill material is essential and the most

efficient procedure to accomplish articulation therapy, especially when targeting speech sounds at the syllable and word level. Drill is very effective when combined with stimulating stimuli and reinforcement materials, a positive clinical attitude, and a quick speed.

Articulation and phonological treatment protocols specify various kinds of stimuli to evoke the target phoneme productions. Finding appropriate words and pictures to evoke target phoneme productions can be an extremely time consuming task for a busy clinician. An articulation drill book will lighten the task of speech pathologist who frequently needs to spend considerable time developing word lists and organizing speech materials from many diverse sources. Since the drill materials are divided by parts of speech, the speaker will be able to move immediately from isolated word level to the grammatical use of speech in 2-3 word phrases and structurally complete sentences.

Drill materials produce effective results over relatively short period of time. Articulation drill book also contains materials for the purpose of developing listening skills and auditory discrimination, both vital and necessary before the child is able to read or write with any degree of proficiency. They are organized to provide practice drill for persons with articulation difficulty of either functional or organic origin. A single source book containing suitable speech drills can easily be taken from school to school. Time devoted to speech therapy will be more effectively utilized when a single source is used. Time will not be lost in changing, arranging and shifting about of different materials if a single source is used while the speech clinician in hospitals, clinics, and private practice is not necessarily faced with the task of transporting different materials, he or she needs to spend countless hours organizing appropriate speech materials from different sources. A single source book can lighten the task of

this group as well. The drill material could also be used by the teacher of the early elementary grades to facilitate the growth of consonant mastery. The teacher can use these word lists to develop a reading vocabulary and teach word attack.

There are so many attempts to provide stimulus material in different languages to provide articulation therapy. Since articulation disorder is seen more in children with cleft lip and palate, articulation drill material is essential for improving articulation. Some of the books which made attempt to provide stimuli materials for articulation correction are given in table 2.1.

**Table 2.1:**

*List of stimulus books for articulation correction available*

<b>Sl no.</b>	<b>Title of the book</b>	<b>Authors</b>	<b>Year of publication</b>
1	Sound Stimuli for /p/ /b/ /f/ /v/ /s/ /z/, Book for Treatment Protocols for Articulation and Phonological Disorders.	M. Hegde, Ph.D., Adriana Peña-Brooks, M.A.	2006

3	Sound Stimuli for /k/ /g/ /m/ /n/ /ŋ/ /l/, Book 3 for Treatment Protocols for Articulation and Phonological Disorders	Hegde, M., Peña-Brooks, M.A.	2007
4	Sound Stimuli for /θ/ /ð/ /ɾ/ /ʎ/ /ɜ/ /w/ /h/ /j/, Book 4 for Treatment Protocols for Articulation and Phonological Disorders	Hegde, M., Peña-Brooks, M.A.	2007

In Indian context, articulation drill book for individual with CLP was developed as a part of dissertation in few languages given in table 2.2. below.

**Table 2.2**

*List of articulation drill book available in Indian context.*

<b>Sl no.</b>	<b>Title of the book</b>	<b>Authors</b>	<b>Year of publication</b>
1.	Development of articulation drill book for Cleft Palate population in Telugu.	Hemalatha	2011
2.	Development of Articulation Drill Book for Cleft Palate Population in Kannada.	Prasad	2011
3.	Development of articulation drill book for cleft palate population in Malayalam.	Weshley	2011
4.	Development of articulation drill book for cleft palate population in Hindi	Barkha	2012

The above table lists the various articulatory drill material available in different Indian languages. Articulation drill material is available in Telugu, Kannada, Malayalam, and Hindi languages and is essential to be developed in the other Indian languages as well. In the state of Maharashtra, Marathi is a widely spoken, there are many centers which provide free surgeries for children with cleft lip and palate. From the previous studies we can infer that articulation drill material is necessary to assess as well as manage individuals with cleft lip and palate to make CLP speech intelligible. As there is no published articulation drill material especially for individuals with cleft lip and palate in Marathi language the present study was planned.

## CHAPTER III

### METHOD

The present study was aimed at developing an articulation drill book in Marathi language for persons with cleft palate. The objective of the present study is as follows:

- (a) To identify the pressure consonants in Marathi language.
- (b) To compile the wordlist and picture material (meaningful words) loaded with pressure consonants in initial, medial, and final position in Marathi language.
- (c) To compile paired words loaded with pressure consonants in Marathi language
- (d) To develop sentences loaded with pressure consonants in Marathi language.
- (e) To obtain feedback of the developed stimuli by native speaker of Marathi SLP's.

The development of the articulation drill material was carried out in three phases. The phases included:

**Phase 1:** Identification of pressure consonants in Marathi language.

**Phase 2:** Compilation of words and pictures for articulation drill material. This phase was further carried out under 4 stages.

**Stage I** - Compilation of words (picturable and non picturable) with pressure consonants in three different positions (Initial, medial and final).

**Stage II** – Compilation of paired words with pressure consonants.

**Stage III** – Development of sentences loaded with pressure consonants.

**Stage IV** – Selection of pictures for words in three positions.

**Phase 3:** Content validation of articulation drill book.

### **3.1. Phase 1: Identification of pressure consonants in Marathi language.**

Individuals with repaired / unrepaired cleft lip and palate have difficulty in producing pressure consonants (Jones et al, 2003). Thus, the present study aimed at developing an articulation drill book loaded with pressure consonants in Marathi language. Initially, the pressure consonants of Marathi language were identified. For this purpose, an extensive review was carried on the available material describing the phonology of Marathi language. The following books were reviewed for the same and is mentioned in table 3.1.

**Table 3.1**

*Referred books on the phonology of Marathi language.*

<b>Sl no.</b>	<b>Title of the book</b>	<b>Authors</b>	<b>Year of publication</b>
1.	The Phonology and Morphology of Marathi	Kelkar Ashok Ramchandra	1958
2.	The Indo aryan languages	Colin Masica	1993
3.	Pronunciation Problem of Marathi Speaker	Ghatage C	2013
4.	Phonotactic frequency in Marathi	Berkson, Kelly and Nelson	2017

The description provided by Berkson et al (2017) of phonology in Marathi language is considered for the present study. The phonemes considered are given in the table 3.2 below.

**Table 3.2**

*The description of phonology in Marathi language provided by Berkson et al (2017).*

	<b>Bilabial</b>	<b>Dental</b>	<b>Alveolar</b>	<b>Retroflex</b>	<b>Palatal</b>	<b>Velar</b>	<b>Glottal</b>
<b>Stops</b>	p      b p <sup>h</sup> b <sup>h</sup>	ʈ    ɖ ʈ <sup>h</sup> ɖ <sup>h</sup>		t      d t <sup>h</sup> d <sup>h</sup>		k      g k <sup>h</sup> g <sup>h</sup>	
<b>Affricates</b>			ts		tʃ      dʒ tʃ <sup>h</sup> dʒ <sup>h</sup>		
<b>Fricatives</b>			s		ʃ		h

Thus, the present study consisted of articulation drill material with 16 stop consonants, 5 affricates and 2 fricatives and 1 glottal.

### **3.2 Phase 2: Compilation of words and picture for articulation drill material.**

Phase 2 was further carried out in 4 stages which are described below:

#### **3.2(a). Stage I- Compilation of words loaded with pressure consonants in three different positions (Initial, medial and final).**

The first stage of phase 2 included identifying words loaded with pressure consonants. Hence, extensive research was carried out to find words loaded with pressure consonants. These words were selected from different resources which included Marathi balbharti school textbooks (grade iii to ix), children's story books, newspaper, internet, and dictionary. Following this, an attempt was made and the word

list was classified into (a) picturable words, and (b) non picturable words. Furthermore, the words were classified based on the simplicity, complexity and picturability.

The picturable words were identified as those words which were represented by visual image, easy for the child to understand, present in the vocabulary of the children above 3 years of age and occurring frequently in their environment. Additionally, care was taken to select colorful pictures for the articulation drill material. Example for picturable words are as follows: पाव (/pa:v/). Non picturable words were identified as those which could not be represented visually or through pictures. The words which are simple, frequently used in the day to day conversation were given preference. Example: पुढे (/puḍʰe:/), सपाट (/səpa:t/), ताप (/t̪a:p/).

Finally, the word list was arranged in increasing order of complexity. The simple words were present in the beginning of the word list and the complex words in the end. The complex words included cluster productions and blends. Thus, the word list consisting of picturable and non-picturable words with pressure consonants in initial, medial and final consonants were prepared. Nasal consonant was excluded in the present study.

### **3.2 (b) Stage II - Compilation of paired words loaded with pressure consonants.**

The second stage of phase 2, was compilation of paired words with pressure consonants. Paired words were considered as discrimination training is an important stage of articulation therapy for children with CLP. Few paired words considered in the present study are as follows: बस-खस (/bəs-kʰəs/), भूत – पूत (/bʰu:t̪ - pu:t̪/), ताजी-भाजी (/t̪a:ʒi:-bʰa:dʒi:/).

### **3.2. (c) Stage III - Development of sentences loaded with pressure consonants**

Stage III of phase 2, included development of sentences loaded with pressure consonants. Sentences were considered in the present study as they aid in generalization, which is also considered as one of the important stage in articulation therapy. The sentences were prepared using the words loaded with pressure consonants in different positions within the sentences. The sentences ranged from simple to complex. They were selected based on the frequency of occurrence of word, simplicity, meaningfulness, length of the word in the language. Nasal consonants were not considered in the formation of sentences. An example of the sentence loaded with pressure consonants is as follows: परुल परी आहे (/pəɾul pəri: a:ɦe:/)

### **3.2 (d) Stage IV - Selection of pictures for words in three positions.**

Stage IV of phase 2 included selection of pictures for word in initial, medial and final position. Picturable words were considered as stimulability is important, in terms of providing auditory, visual and tactile cues to enhance learning. For each word, three colorful and unambiguous pictures were selected keeping in consideration the middle socio – economic status and other cultural aspects of the population considered in the present study. Three appropriate pictures were selected for each target sound to represent the word. Further the validation of words and pictures is discussed in phase 3 of the study.

### **3.3 Phase 3: Content validation of articulation drill book.**

Content validation for the word, paired word, sentences, and picture stimuli was carried out in this phase. The stimuli and words were given to three experienced speech language pathologist (SLP's) for content validation. The judges considered in the present study were native speakers of Marathi with a minimum of three years clinical

experience in communication disorders. The judges were requested to rate the non-picturable word list on the following parameters:

For picturable words the SLP's were requested to judge and select one picture out of 3 [picture (a), (b) and (c)] based on the iconicity. For paired word and sentences, judges were requested to rate based on the parameters: (a) meaningfulness, and (b) familiarity using a 3 point rating scale where 0 indicated no meaningful/not familiar, 1-fairly meaningful/familiar and 2-meaningful/familiar.

For picturable words the SLP's were requested to judge and select one picture out of 3 [picture (a), (b) and (c)] based on the iconicity. For paired word and sentences, judges were requested to rate based on the parameters: (a) meaningfulness, and (b) familiarity using a 3 point rating scale where 0 indicated no meaningful/not familiar, 1-fairly meaningful/familiar and 2-meaningful/familiar.

The judges were made aware that the stimuli will be used mainly for children with cleft lip and palate. They were also informed that the present study considered only pressure consonants and excluded nasal consonants. The valuable feedback rating was considered for the compilation on the articulation drill book.

Overall, the judges were requested to rate the material. For this, scale of "Feedback questionnaire for aphasia treatment manual" (Goswami et al, 2010) was used. Various parameters relevant to the present study were selected from the above-mentioned scale and are as follows: (a) simplicity, (b) proverbiality, (c) accessible, (d) complexity, (e) trainability, (f) stimulability, (g) size of the picture, (h) color and appearance, (i) feasibility, and (j) scoring pattern.

Based on this, the feedback was obtained and analysis was carried out. In instances where two judges had an agreement of rating of the words, paired words,

sentences, and picturable words as '2' and '1', they were considered in the final list. Instances where two judges were not in agreement or rated the stimuli as '0' was excluded from the list.

## CHAPTER IV

### RESULTS AND DISCUSSION

The present study was aimed at developing an articulation drill book in Marathi language for persons with CLP. The objective of the present study are as follows:

- (a) To identify the pressure consonants in Marathi language.
- (b) To compile the wordlist and picture stimuli (meaningful words) loaded with pressure consonants in initial, medial, and final position in Marathi language.
- (c) To compile paired words loaded with pressure consonants in Marathi language.
- (d) To develop sentences loaded with pressure consonants in Marathi language.
- (e) To obtain feedback of the developed stimuli by native speaker of Marathi SLP's.

The present study was carried out in 3 phases. Objective (a), (b), (c), and (d), are addressed by phase I and II, and objective (e) is addressed by phase III.

#### **4.1. (a) Identification of pressure consonants in Marathi language.**

The first objectives of the study was to identify the pressure consonants in Marathi language. For this purpose, an extensive review was carried out on the available description of the phonology in Marathi language. The phonology description provided by Berkson et al., (2017) in Marathi language was considered for the present study. Thus, the present study consisted of developing articulation drill material with 16 stop consonants, 5 affricates and 2 fricatives in initial, medial, and final position.

Further, in the following sections the details of the word list and picture list are discussed below.

#### **4 .1. (b) Compilation of words and picture stimuli loaded with pressure**

##### **consonants in three different position (initial, medial, and final).**

The second objective of the study was to develop picturable word list and non picturable word list using pressure consonant in three different word positions in Marathi. The words (picturable and non-picturable) were identified by carrying out extensive research of different resources available. The words shortlisted, were selected from the different resources. Further, the list was classified as (i) non picturable word list, and (b) picturable word list.

(i) The selected non-picturable words were provided to 3 speech language pathologist (SLP) for content validation. 3 SLP's were requested to judge and select the words based on non-picturability, meaningfulness, and familiarity.

A total of 670 words were selected to develop the word list from the above mentioned resources, out of which 661 was considered in to the final list. The remaining words were excluded from the word list, as the judges rated them '0' due to their picturability and less familiarity. The details of the words considered across three different positions is given in table 4.1.

**Table 4.1**

*Details of total number of non-picturable words across the different place and manner of articulation for the articulation drill book in Marathi*

<b>P</b>	<b>Bilabial</b>			<b>Dental</b>			<b>Alveolar</b>			<b>Retroflex</b>			<b>Palatal</b>			<b>Velar</b>			<b>Total</b>		
	<b>I</b>	<b>M</b>	<b>F</b>	<b>I</b>	<b>M</b>	<b>F</b>	<b>I</b>	<b>M</b>	<b>F</b>	<b>I</b>	<b>M</b>	<b>F</b>	<b>I</b>	<b>M</b>	<b>F</b>	<b>I</b>	<b>M</b>	<b>F</b>	<b>I</b>	<b>M</b>	<b>F</b>

<b>T</b>	68	58	25	66	63	39	18	19	15	15	34	23	49	33	12	47	52	25	<b>661</b>		

*Note : P-Place, Mn – Manner, I – initial position, M – medial position, F- final position, S – Stops, A – Affricate, F – Fricative, T – Total*

A total number of 661 words were selected, out of which 515 were stops, 84 were affricates, 62 were fricatives. Further, the category under stops included,

(a) Among bilabials, 68 words were in initial position; 58 in medial position, and 25 in final position. The details of the words considered based on the phoneme for bilabials is given in table 4.2 below

**Table 4.2**

*Total number of non picturable words selected for target phoneme for bilabials*

Bilabials	Words (non-picturable)		
	I	M	F
/p/	15	21	15
/b/	20	17	5
/p <sup>h</sup> /	13	10	2
/b <sup>h</sup> /	20	10	3

(b) Among dental, 66 words were in initial position, 63 in medial position, and 39 in final position.

The details of the words considered based on the phoneme for dentals is given in table 4.3 below.

**Table 4.3**

*Total number of non picturable words selected for target phoneme for dentals.*

Dental	Words (non-picturable)		
	I	M	F
/t̪/	20	25	26
/t̪ʰ/	13	6	2
/d̪/	19	24	6
/d̪ʰ/	14	8	5

(c) Among retroflex, 15 words were in initial position, 34 in medial position, and 23 in final position. The details of the words considered based on the phoneme for retroflex is given in table 4.4 below.

**Table 4.4**

*Total number of non picturable words selected for target phoneme for retroflex.*

(ii) The selected picturable words were provided to 3 speech language pathologist (SLP) for content validation. 3 SLP's were requested to judge and select the words based on iconicity.

A total of 500 picturable words for which 1500 pictures were selected to develop the material from the above mentioned resources, out of the 500 words, 480 were considered in the final word list. The remaining picturable words were excluded from the list, as the judges rated them '0' as they were not iconic, and not familiar. The details of the words considered across three different positions is in given in table 4.11

**Table 4.11**

*Details of total number of picturable words across the different place and manner of articulation for the articulation drill book in Marathi*

	Bilabial			Dental			Alveolar			Retroflex			Palatal			Velar			Total			
	I	M	F	I	M	F	I	M	F	I	M	F	I	M	F	I	M	F	I	M	F	
<b>P</b>																						
<b>S</b>	64	41	11	30	32	16	-	-	-	14	38	23	-	-	-	47	40	18	155	151	68	
<b>A</b>	-	-	-	-	-	-	5	2	2	-	-	-	31	15	4	-	-	-	36	17	6	
<b>Mn</b>																						
<b>F</b>	-	-	-	-	-	-	16	12	7	-	-	-	7	5	-	-	-	-	23	17	7	
<b>T</b>	64	41	11	30	32	16	21	14	9	14	38	23	38	20	4	47	40	18	<b>480</b>			

*Note : P-Place, Mn – Manner, I – initial position, M – medial position, F- final position, S – Stops, A – Affricate, F – Fricative, T – Total*

A total number of 480 picturable words were selected, out of which 374 were stops, 59 were affricates, and 47 were fricatives. Further, the category under stops,

- (a) Among bilabials, 64 words were in initial position; 41 in medial position, and 11 in final position. The details of the words considered based on the phoneme for bilabials is given in table 4.12 below

**Table 4.12**

*Total number of picturable words selected for target phoneme for bilabials*

Bilabials	Words (picturable)		
	I	M	F
/p/	32	16	5
/b/	17	16	1
/p <sup>h</sup> /	9	6	3
/b <sup>h</sup> /	6	3	2

- (b) Among dental, 30 words in initial position, 32 in medial position, and 16 in final position. The details of the words considered based on the phoneme for dentals is given in table 4.13 below.

**Table 4.13**

*Total number of picturable words selected for target phoneme for dentals.*

Dentals	Words (picturable)		
	I	M	F
/t̪/	7	16	9
/t̪ʰ/	3	1	2
/d̪/	17	12	3
/d̪ʰ/	3	3	2

(c) Among retroflex, 14 words in initial position, 38 in medial position, and 23 in final position. The details of the words considered based on the phoneme for retroflex is given in table 4.14 below.

**Table 4.14**

*Total number of picturable words selected for target phoneme for retroflex.*

Retroflex	Words (non-picturable)		
	I	M	F
/t̪/	8	17	11
/t̪ʰ/	-	-	8
/d̪/	5	19	3
/d̪ʰ/	1	2	1

(d) Among velar, 47 words in initial position, 40 in medial position, and 18 in final position. The details of the words considered based on the phoneme for velar is given in table 4.15 below.

**Table 4.15**

*Total number of picturable words selected for target phoneme for velar*

Velar	Words (picturable)		
	I	M	F
/k/	22	21	13
/k <sup>h</sup> /	7	3	-
/g/	14	14	4
/g <sup>h</sup> /	4	2	1

Further, the category under affricates,

(a) Among alveolar, 5 words were in initial position; 2 in medial position, and 2 in final position. The details of the words considered based on the phoneme for alveolar is given in table 4.16 below.

**Table 4.16**

*Total number of picturable words selected for target phoneme for alveolar*

Alveolar	Words (picturable)		
	I	M	F
/ts/	5	2	2

Among palatal, 31 words were in initial position, 15 in medial position, and 4 in final position. The details of the words considered based on the phoneme for palatal is given in table 4.17 below.

**Table 4.17.**

*Total number of picturable words selected for target phoneme for palatal.*

Palatal	Words (picturable)		
	I	M	F
/tʃ/	7	2	3
/tʃ <sup>h</sup> /	6	-	-
/dʒ/	9	13	1
/dʒ <sup>h</sup> /	9	-	-

Further, the category under fricatives,

- (a) Among alveolar, 16 words were in initial position; 12 in medial position, and 7 in final position. The details of the words considered based on the phoneme for alveolar is given in table 4.18 below.

**Table 4.18.**

*Total number of picturable words selected for target phoneme for alveolar.*

Alveolar	Words (non-picturable)		
	I	M	F
/s/	16	12	7

- (b) Palatal, 7 words in initial position, and 5 in medial position. The details of the words considered based on the phoneme for palatal is given in table 4.19 below.

**Table 4.19.**

*Total number of picturable words selected for target phoneme for palatal.*

Palatal	Words (picturable)		
	I	M	F
/ʃ/	7	5	-

The detailed word list for picturable word is given in table 4.20.

**Table 4.20.**

*Picturable word list and pictures of these words are provided in Appendix (2) in CD.*

#### 4.1. (c) To compile paired words loaded with pressure consonants in Marathi language.

The third objective of the study was to compile the paired words for pressure consonants in Marathi language. Paired words were those words which have different consonants and the same vowel or, different vowels and the same consonant. The prepared paired words were provided to 3 speech language pathologist (SLP) for content validation. 3 SLP's were requested to judge and rate the words based on meaningfulness.

A total of 238 were selected to develop paired word list for pressure consonants in Marathi, out of which 228 was considered in the final paired word list.

The remaining paired words were excluded from the list, as the judges rated them '0' due to their non-meaningfulness. The details of the paired word list in across place and manner of articulation is listed below in table 4.21.

**Table 4.21**

*Details of total number of paired words across the different place and manner of articulation for the articulation drill book in Marathi.*

<b>Place</b>	<b>Bilabial</b>	<b>Dental</b>	<b>Alveolar</b>	<b>Retroflex</b>	<b>Palatal</b>	<b>Velar</b>	<b>Total</b>
<b>Manner</b>							
<b>Stops</b>	38	46	-	30	-	57	171
<b>Affricates</b>	-	-	6	-	29	-	35
<b>Fricatives</b>	-	-	15	-	7	-	22
<b>Total</b>	38	46	21	30	36	57	<b>228</b>

A total number of 228 words were selected, out of which were 171 stops, 35 were affricates and 22 were fricative. Further, the category under stops included

(a) 38 were **bialbial**. The details of the paired words considered based on the phoneme for bialbals is given in table 4.22 below.

**Table 4.22.**

*Total number of paired words selected for target phoneme for bilabial.*

Bilabials	Paired words
/p/	11
/b/	11
/p <sup>h</sup> /	5
/b <sup>h</sup> /	11

b) 46 were **dental**. The details of the paired words considered based on the phoneme for dentals is given in table 4.23. below.

**Table 4.23**

*Total number of paired words selected for target phoneme for dentals.*

Dentals	Paired words
/t/	14
/t <sup>h</sup> /	10
/d/	14
/d <sup>h</sup> /	8

(c) 330 were **retroflex**. The details of the paired words considered based on the phoneme for retroflex is given in table 4.24 below.

**Table 4.24**

*Total number of paired words selected for target phoneme for dentals.*

Retroflex	Paired words
/t/	14
/t <sup>h</sup> /	8
/d/	4
/d <sup>h</sup> /	4

d) 57 were **velar**. The details of the paired words considered based on the phoneme for velar is given in table 4.25 below.

**Table 4.25**

*Total number of paired words selected for target phoneme for velar.*

Velar	Paired words
/k/	21
/k <sup>h</sup> /	15
/g/	13
/g <sup>h</sup> /	8

Further, the category under affricates included

(a) 6 were **alveolar**. The details of the paired words considered based on the phoneme for alveolar is given in table 4.26 below.

**Table 4.26**

*Total number of paired words selected for target phoneme for alveolar.*

Alveolar	Paired word
/ts/	6

(b) 29 were **Palatal**. The details of the paired words considered based on the phoneme for palatal is given in table 4.27 below.

**Table 4.27**

*Total number of paired words selected for target phoneme for palatal.*

Palatal	Paired words
/tʃ/	5
/tʃʰ/	9
/dʒ/	7
/dʒʰ/	8

Further, the category under fricatives included

(a) 15 were **alveolar**. The details of the words considered paired word based on the phoneme for alveolar is given in table 4.28 below.

**Table 4.28**

*Total number of paired words selected for target phoneme for alveolar.*

Alveolar	Paired word
/s/	15

b) 7 were **palatal**. The details of the paired words considered based on the phoneme for palatal is given in table 4.29 below.

**Table 4.29**

*Total number of paired words selected for target phoneme for palatal.*

Palatal	Paired word
/ʃ/	7

The detailed word list for paired word is given in Table 4.30.

**Table 4.30**

**4.1 (d) To develop sentences loaded with pressure consonants in Marathi language.**

The fourth objective of the study was to develop sentences loaded with pressure consonants in Marathi language. The sentences were prepared using the words loaded with pressure consonants in different positions within the sentences. The prepared sentences were provided to 3 speech language pathologist (SLP) for content validation. 3 SLP's were requested to judge and rate the sentences based on meaningfulness, and familiarity

A total of 178 sentences were prepared, out of which 173 were selected for the final sentence list using pressure consonants within the words in the sentences in Marathi language. The remaining sentences were excluded from the list, as the judges rated them '0', due to their non-meaningfulness and familiarity. The details of the sentences list in across place and manner of articulation is listed below in table 4.31.

**Table 4.31**

*Details of total number of sentences across the different place and manner of articulation for the articulation drill book in Marathi.*

<b>Place</b>	<b>Bilabial</b>	<b>Dental</b>	<b>Alveolar</b>	<b>Retroflex</b>	<b>Palatal</b>	<b>Velar</b>	<b>Total</b>
<b>Manner</b>							
<b>Stops</b>	33	34	-	25	-	33	125
<b>Affricates</b>	-	-	4	-	24	-	28
<b>Fricatives</b>	-	-	10	-	7	-	17
<b>Total</b>	33	34	14	25	31	33	<b>170</b>

A total number of 170 sentences were selected, out of which were 125 stops, 28 were affricates, and 17 were fricatives. Further, the category under stops included, in which

(a) 33 were **bilabial**. The details of the sentences considered based on the phoneme for bilabials is given in table 4.32 below.

#### 4.1 (e) To obtain feedback of the developed stimuli by native speaker of Marathi Speech language pathologist.

As part of the last objective of the study, 3 speech language pathologist (SLP) were requested to judge the content for words, paired words, sentences, and picture using 3 point rating scale. The judges (SLP's) considered in the present study were

native speakers of Marathi with a minimum of three years clinical experience in communication disorders. For overall judgement of the articulation drill book in Marathi, the judges were requested to rate the material. For this, scale of “*Feedback questionnaire for aphasia treatment manual*” (Goswami et al, 2010) was used. This scale, is listed in Appendix 1.

Based on the overall rating scale, the overall articulation drill book in Marathi language, was rated as ‘appropriate’, based on the following parameters, : a) simplicity, (b) proverbility, (c) accessible, (d) complexity, (e) trainability, (f) stimulability, (g) size of the picture, (h) color and appearance, (i) feasibility, and (j) scoring pattern.

## CHAPTER V

### SUMMARY AND CONCLUSION

Cleft lip and/or palate (CLP) is a congenital condition in which the tissue that forms the upper lip and/or palate fail to align properly during the initial stages of gestation and leave a fissure on the upper lip and/or the palate. CLP is a globally attested condition with a worldwide frequency of 1 in 700 live births (Mossey et al., 2009). In India the number of infants born every year with CLP is 28,600 with mean 78 affected infants are born every day, or 3 infants with CLP born every hour (Mossey & Little, 2009).

Individuals with CLP have several associated problems which includes defective nasolabial region, impaired bone structure, difficulty in swallowing, hearing impairment, dental malocclusion, delayed development, and delayed social growth. These associated problem in individual with CLP requires them to undergo early rehabilitation. Apart from these children with CLP have speech and language impairment. CLP leads to impaired articulation and resonance, which leads to a significant unintelligible speech. Further, children with CLP mainly exhibit articulatory errors in pressure consonants, which includes substitution, omissions, distortion, and additions, out of which substitution more often leads to compensatory articulation. The presence of the articulatory errors calls attention for articulation therapy. Among the various procedure followed to accomplish articulation therapy, the most effective and efficient procedure is articulation drill.

An articulation drill book will lighten the task of speech language pathologists (SLP), who frequently need to spend considerable time developing word list and organizing speech materials, from many diverse sources. Articulation drill material

comprises of syllables, word at different position, 2-3 word phrases, and grammatically complete sentences making it accessible for the SLP's. Moreover, articulatory drill material also produces effective results over a relatively short period of time. Articulation drill material is an efficient method used to target at the syllable, words, sentence, and discourse level.

There are several articulation drill materials in different languages to provide articulation therapy. In Indian context, articulation drill book for individual with CLP has been developed as a part of dissertation. Articulation drill material is available in Telugu (Hemalatha, 2011), Kannada (Prasad, 2011), Malayalam (Weshley, 2011), and Hindi (Barkha, 2012) language. Among the various languages spoken in subcontinent of India, Marathi is widely spoken in the state of Maharashtra. In the state of Maharashtra, there are approximately 13 hospital which provide free CLP surgery. Without standard, readily available material it is difficult to document the effect of surgery in the improvement of articulation in children with CLP. Also, the resource material is limited in the area of management for children with CLP. In view of this, present study was to develop articulation drill material for individual with CLP in Marathi language, with the following objectives:

- (a) To identify the pressure consonants in Marathi language.
- (b) To compile the wordlist and picture stimuli (meaningful words) loaded with pressure consonants in initial, medial, and final position in Marathi language.
- (c) To compile paired words loaded with pressure consonants in Marathi language.
- (d) To develop sentences loaded with pressure consonants in Marathi language.
- (e) To obtain feedback of the developed stimuli by native speaker of Marathi SLP's

Preparation of the articulation drill material: The drill material was developed into 3 phases.

**5.1 (i).** Identification of pressure consonants in Marathi language was carried out. A total of 16 stops, 5 affricates, and 2 fricatives, were considered in the present study based on phonology of Marathi (Berkson et al., 2017).

**5.2 (ii).** The second phase consisted of four stages:

**(I) Compilation of words loaded with pressure consonants in three different positions.**

The picturable word list and non-picturable word list using pressure consonant in three different positions was identified. The words were identified from various available resources. The identified, and shortlisted words were then, classified as picturable words and non picturable word based on the vocabulary of the children above 3 years of age, frequency of occurrence, simplicity and meaningfulness of words. The list consisted of both picturable and non picturable word list in initial, medial and final position excluding nasal consonants.

**(II) Compilation of paired words loaded with pressure consonants.**

A set of paired words loaded with pressure consonants were identified and compiled. The paired words were prepared by changing the consonants and the same vowel or by different vowel and same consonants. Paired words were considered as this aid in discrimination training which is an important stage of articulation therapy.

**(III) Development of sentences loaded with pressure consonants.**

As generalization is an important stage in articulation therapy, sentences were prepared. Care was taken to use the same pressure consonants in different positions

within the sentences. Sentences were prepared based on the frequency, meaningfulness, length of the words in the Marathi language excluding nasal consonants.

**(IV) Selection of pictures for words in three positions.**

As stimulability in terms of auditory, visual, or tactile cues in order to enhance learning is important, picture stimuli was prepared. Pictures for the target words were selected from the google images. For each word three colorful and unambiguous pictures were selected. The pictures were selected by the investigator for each target sound appropriately represents the word.

**5.1 (iii).** The third phase addresses objective (e), where the content validation of the drill book has been carried out.

For content validation, 3 SLP's were requested to rate the words (picturable and non-picturable) list, paired words and sentences based on the 3 point rating scale which consist of following parameters, (a) non-picturability, (b) meaningfulness, (c) familiarity, and (d) frequency of occurrence in the language. The judges (SLP's) considered in the present study were native speakers of Marathi with a minimum of three years clinical experience in communication disorders.

Finally, the judges were requested to rate the overall articulation drill book in Marathi, using the scale of "Feedback questionnaire for aphasia treatment manual" (Goswami et al., 2010) listed in Appendix 1. Based on this, the feedback was obtained and analysis was carried out. In instances where two judges had an agreement of rating of the words, paired words, sentences, and picturable words as '2' and '1', they were considered in the final list. Instances where two judges were not in agreement or rated the stimuli as '0' was excluded from the list.

Based on all the above feedback the articulation drill book was developed and consists of four sections.

**Section I:** Word list

**Section II:** Pair words

**Section III:** Sentences

**Section IV:** Picturable words.

In section I, word list (non-picturable) was compiled in initial, medial and final position for each target speech sounds in Marathi and IPA except for the /t<sup>h</sup>/, /tʃ/ in final position, /d/ and /d<sup>h</sup>/ in initial position as they were picturable. Number of words in each position is varied, depending on the frequency of the occurrence of the speech sound. The word final list is in table 1 (results)

In section II, Pair word were provided in Marathi and IPA for all speech sounds .The paired word list were prepared by differing the consonant with same vowel. The number of pair word list is varied for all speech sounds. The number of paired words were depend on frequency of occurrence of the speech sound. The final paired words list is in table (result).

In section III, The sentence list was prepared for each target sound. Some of the sentences are not grammatically correct which were marked in (\*) mark. The final sentences list is in table (result)

In section IV, the picturable word list was compiled in initial, medial and final position for each target speech sounds in Marathi and IPA , except /t<sup>h</sup>/ in initial, and medial position, /tʃ<sup>h</sup>/, and /dʒ<sup>h</sup>/ in medial and final position, and /k<sup>h</sup>/ in final position as they were non picturable. The number of picture words for each target sound varied

according to the frequency of occurrence. The final picturable word list is in table (results) and picture stimuli is in Appendix-2.

The compiled number of stimuli for all sections mention above is given in table 5.1.

**Table 5.1**

*Compiled table of number of stimuli for all sections.*

*Note: TP – Target phoneme, PW- Paired words, St – Sentences, T- Total.*

### **Advantages:**

1. Material helps in providing quicker results by focusing on improvement of child's  
Articulation
2. Maximizes the amount of trials during a speech therapy homework session.
3. Prescribes drills based on where the child is breaking down in the speech sound  
continuum so as to deliver the most effective drills offering the greatest gains.
4. Empowers individuals to make a difference in their child's speech development.
5. Believes the parent/caregiver can develop the skills necessary to make a profound

difference at home by providing highly effective speech drill work.

**Clinical Implication:**

1. It can be used for articulation therapy for clients with cleft lip and palate.
2. It can be provided to parents for home training.
3. This helps in achieving generalization from isolation to words and sentences.
4. It helps clinician to monitor progress of the child's articulation after therapy.

**Limitations:**

1. Drill material is not divided based on the age level of the client.
2. Drill material is not classified based on parts of speech: noun, verb, adjective and adverb.
3. Drill material is primarily focused on providing the drill material, not emphasizing on method of elicitation of speech sound errors.

**APPENDIX- I**

**Validation form used for the content validation of the articulation drill stimulus  
in Marathi.**

Adapted from the Manual for Non-Fluent Aphasia Therapy in Kannada

(Goswami et al., 2012)

<b>Sl. No</b>	<b>Parameters</b>	<b>Very Poor</b>	<b>Poor</b>	<b>Fair</b>	<b>Good</b>	<b>Excellent</b>
1.	Simplicity					
2	Proverbility					
3.	Accessibility					
4.	Complexity					
5.	Trainability					
6.	Stimulabilty					
7.	Size of picture					
8	Color and apperance					
9.	Feasibility					
10.	Iconicity					

### **Format for assessing content validity**

**The parameters and their operational definition for rating the *word list, paired word list, and sentences* are as follows:**

1. **Simplicity:** Are the test stimuli comprehensible?
2. **Proverbiality:** Is the test material familiar to the user?
3. **Accessibility:** Is the test material user-friendly?
4. **Complexity:** Is the material arranged in the increasing order of difficulty?
5. **Trainability:** Can the stimuli be used for intervention purposes in different milieu?
6. **Stimulability:** Does the stimulus material elicit responses from the individuals?

**The parameters and their operational definition for rating the *picture stimuli* are as follows:**

1. **Size of the picture:** Whether the picture stimuli are of appropriate size?
2. **Color and appearance:** Are the picture stimuli appropriate in terms of colour and dimension?
3. **Iconicity:** Does the picture stimuli appear to be recognizable and representational?
4. **Stimulability:** Does the stimulus material elicit responses from the individuals?
5. **Accessibility:** Is the test material user-friendly?
